

# Why measure CO<sub>2</sub> in your hospital?

**You can't see CO<sub>2</sub>**, but we all breathe it in and out 24 hours a day, every day. High CO<sub>2</sub> levels in your hospital can interfere with the occupants' oxygen uptake, causing dizziness, headaches, difficulty concentrating, fatigue, sleepiness and impaired cognitive function. The CO<sub>2</sub> breathed out by others can carry invisible airborne viruses and microbes that spread disease. **PL's** new Building Health Graphing Toolkit empowers you to quickly detect and correct CO<sub>2</sub> problems. Make your hospital a healthier and safer place with a **Building Health Graphing Toolkit** from **Precision**.
